Anvest

The research tools institutions use, in plain language, for every Indian investor.

Ask Anvest Intelligence a question in ordinary words. It answers from exchange filings, builds the screen, tests the idea with Indian trading costs and helps you plan the money. A first-time investor can start here. A SEBI-registered analyst can open the filing behind the answer.

Institutions have analysts, terminals and quant desks. Everyone else has a PDF and a tip.

The same four jobs, on either side of the divide

The job	At an institution	For a retail investor or a small adviser today
Find out what a company actually reported	Analysts and paid filing search	Exchange PDFs read by hand, many of them scans. NSE and BSE carried 61,875 announcements in August 2026 alone.
Find companies that fit an idea	Terminal screens on cleaned data	Ratio screeners that expect a query language, or a stock name in a messaging group
Test the idea before risking money	A quant team with cost models	A spreadsheet, or a strategy tool built around price charts
See what it does to my money	A portfolio system and a wealth manager	Generic calculators, and advice from whoever is selling the product

A first-time investor and a two-person advisory firm have the same problem. Neither can afford the desk.

13.4 crore unique investors registered with NSE

4.6 crore active NSE clients

3,900 SEBI-registered research, advisory and PMS firms

Anvest warehouse by announcement date, snapshot 20 Oct 2026. NSE Market Pulse, Jul and Aug 2026. SEBI intermediary directory, 19 Oct 2026.

Indian filings are not machine-ready. A model pointed at them inherits every error.

Four failures found while building the warehouse, with real cases

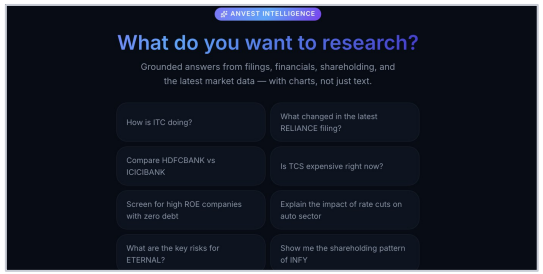

What the source does	A real case	How far it goes
XBRL dates every column with the quarter, even the full-year figures. There is no separate annual file.	RELIANCE Q4 filing: the quarter and full-year contexts both say January to March. The true period sits in other facts in the file.	Q4 and annual filings from FY23 onward
Cash flow is filed half-yearly and year-to-date, often under a context a parser rejects.	Recovered only when the four lines close their own identity. TCS FY21 operating cash flow of ₹38,802 Cr ties to its annual report.	15,899 rows recovered, none failing reconciliation
A secondary source and the filing disagree for the same period.	ADANIPORTS FY25 profit: ₹1,09,197 Cr in a secondary source, ₹11,092 Cr as filed.	3,608 conflicts across 1,022 companies; 1,521 are about 10× out
Bank results arrive as scans, with a hidden text layer that can be wrong in place.	City Union Bank Q1 FY27: capital adequacy reads 21.73 on the page and 27.73 in the text layer. Right row, right column, plausible value.	10 of 10 tier-1 bank results in a 21-filing sample were scans

This is why the product took a year, and why the work keeps its value: a repair made once stays made for every later filing. Inside Anvest the model reads the question and writes the sentence. Code reads the filing and does the arithmetic. When the data is missing, the answer says so.

Anvest data audits, Jul to Sep 2026. The City Union Bank figure was corroborated against the bank's own press release. Sample: 21 NSE filings from 9 banks, Q1 FY27.

From a question to a tested strategy, in one flow

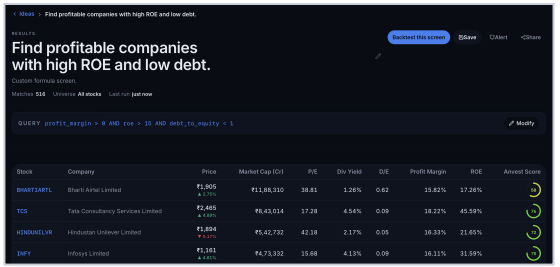

1 Ask

Ask in plain English

“Find profitable companies with high ROE and low debt.”

2 Screen

AI builds the screen

Plain English becomes visible, editable filters across 6,000+ stocks, with a one-click backtest.

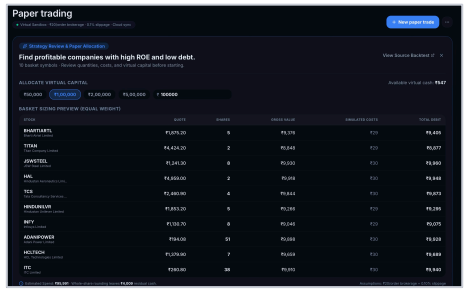

3 Backtest

Test it on history

Brokerage, STT, stamp duty and slippage built in; alpha, drawdown and Sharpe reported, with every rule shown.

4 Practise

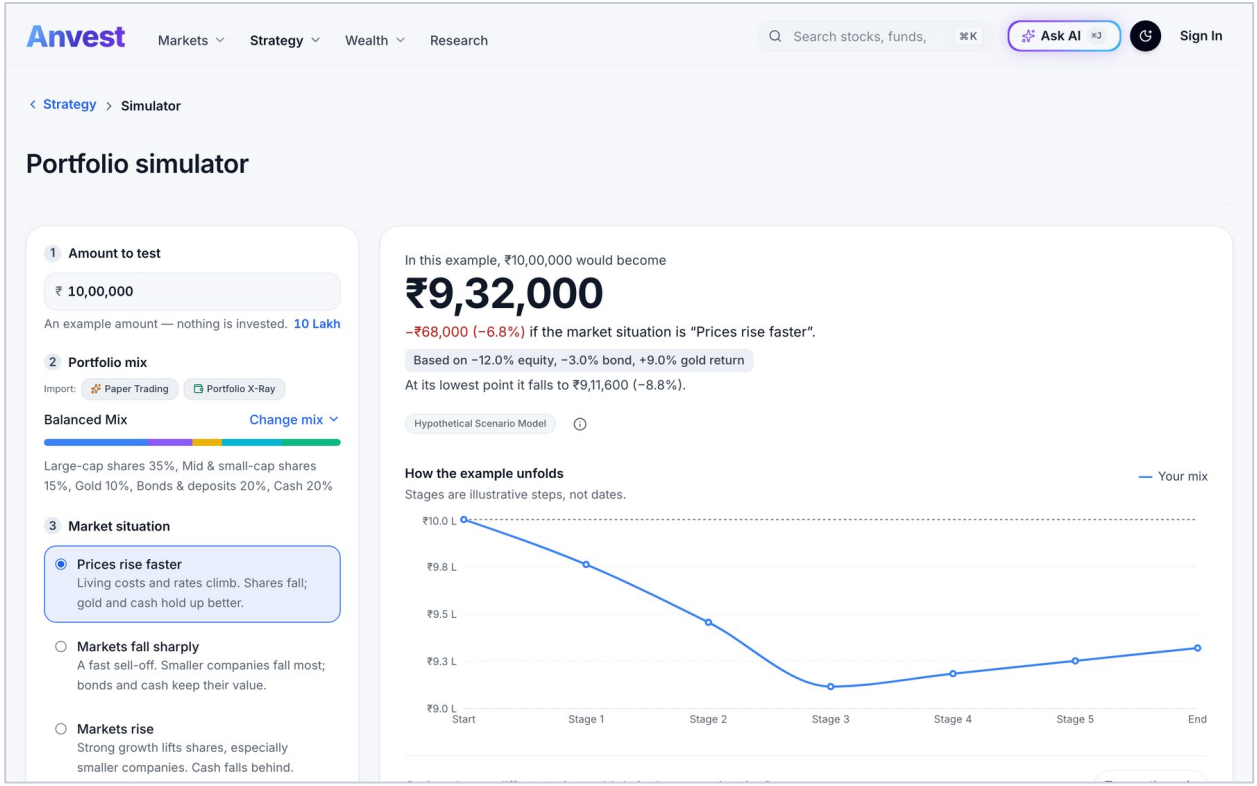

Practise, then act

Paper-trade the strategy with virtual cash and review every decision in a journal.

Product test on the live site, 19 Oct 2026: this prompt produced a 516-stock screen (534 on 1 Nov as filings came in), a one-year costed backtest and a 10-stock paper basket. The model reads the request and code does the arithmetic.

Try the screen, no sign-in

A first-time investor gets the same engine, in words they already use

Portfolio simulator, live without sign-in. ₹10 lakh in a balanced mix under "prices rise faster" becomes ₹9,32,000, with a low of ₹9,11,600. A hypothetical scenario, with its assumptions on the page.

Ask in ordinary words. "How is ITC doing?" "Is TCS expensive right now?" Answers draw on filings, financials, shareholding and market data.

Plan retirement. Tested on 19 Oct: age 32, retiring at 60, spending ₹60,000 a month, ₹5 lakh saved, ₹20,000 a month going in. Anvest answered "Save ₹14,626 more each month", showed its assumptions and solved five ways to close the gap.

Look inside a fund or an IPO. 991 schemes compared on cost, return and risk. IPO pages carry the band, size and dates from the prospectus.

Practise before spending. Virtual cash, real prices, and a journal that asks why you bought.

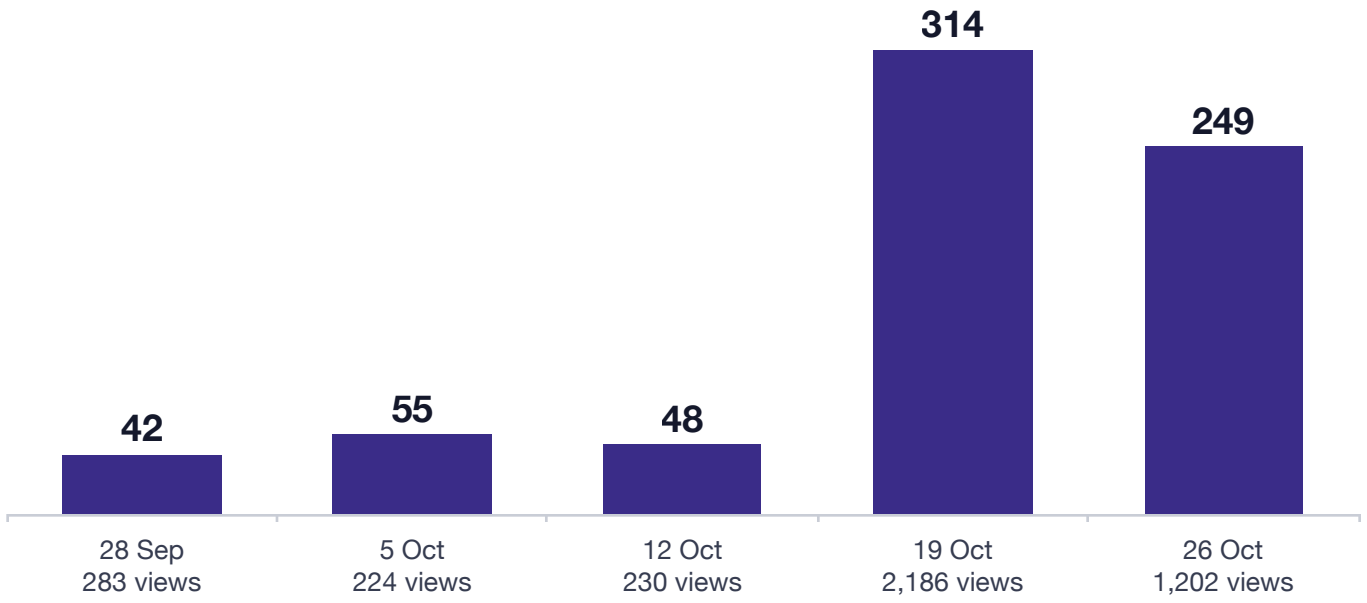

Being built now: one conversation across all of these. Free-text wealth questions will run through the same cash-flow engine, and that build ships once it clears evaluation.

Anvest shows the arithmetic and the assumptions. It does not tell anyone what to buy.

Simulator captured signed out, 1 Nov 2026. Retirement test run in a signed-in session on the live site, 19 Oct 2026. Calculators and planners need a free account.

With no marketing spend, weekly visitors from India rose fivefold in October

Organic visitors from India per week, with page views underneath

5.7 pages

per visitor from India over 31 days (3,882 views, 676 visitors)

57%

of those visitors are on a phone. This is the public, not only desks.

1 to 13 a day

arriving from search, before 24 Oct and since 27 Oct. 297 of 307 came from India; 85% landed on the home page, so most were looking for Anvest by name.

What they opened: screener 145, stock list 97, Anvest Intelligence 75, strategy 50, sign-up 42 (visitors from India).

Accounts, 20 Oct snapshot: 31 registered, 5 of them ours. Of the 26 outside accounts, 15 used a workflow and 13 asked 268 of the 418 logged research questions (the other 150 were internal testing). 7 asked more than once, and 5 came back in a later week.

Revenue: none yet. Checkout is not live, so nobody has been asked to pay. That is what this round tests.

Vercel Web Analytics, exported 1 Nov 2026, India only. Vercel counts a visitor per day, so someone returning on two days counts twice. All-country totals were 2,035 visitors and 5,933 views; we leave out the other 1,359 visitors because most are one-page Windows and Linux sessions from Singapore, the US and China that behave like crawlers. Marketing spend to date is zero (founder).

Since December 2024 advisers answer for their AI output, and since April 2026 retail algos have a legal route

When	What changed	What it means for Anvest
Dec 2024	SEBI's research-analyst and investment-adviser amendments: disclose AI use to clients and stay solely responsible for its output. Existing clients by 30 Apr 2025.	An adviser needs answers that can be checked against the filing before they reach a client.
2025	Zerodha's Kite MCP lets a user connect their account to an AI agent.	The agent can see the portfolio. It still needs checked Indian research behind it.
2025–26	Language models became cheap and good enough to answer in plain words.	At a planning cost of ₹0.75 an answer, a free tier for the public is affordable.
Apr 2026	SEBI's retail algo framework applies to all brokers. Black-box providers need RA registration and exchange empanelment.	Rules a user can read get a lighter path. Anvest's are visible, and testing comes before execution.
Jun 2026	AlphaSense reached $600M+ ARR at a $7.5B valuation selling source-cited AI research to institutions.	The category is proven at the top. Anvest Desk is ₹2,999 a seat a month (about $380 a year), and Plus is ₹199 a month.

SEBI (Research Analysts) (Third Amendment) Regulations 2024; SEBI (Investment Advisers) (Second Amendment) Regulations 2024; SEBI circulars of 4 Feb and 30 Sep 2025; Zerodha; fintech.global, Jun 2026; Anvest operating model (₹0.75 is a planning value, re-measured with each model change).

The market is the investing public. The first paying customers are on a list SEBI publishes.

Sized bottom-up, at list prices

Segment	Who	How many	Price a year	Value a year
Every active investor	Active NSE clients	4.6 crore	₹2,388	₹10,985 Cr
Active traders	SEBI FY25 study population	96 lakh	₹2,388	₹2,292 Cr
All professionals	SEBI firms and ARN holders	3.55 lakh seats	₹35,988	₹1,284 Cr
First buyers	**3,900 SEBI firms and 3,350 top distributors, 3 seats each**	**21,750 seats**	**₹35,988**	**₹78 Cr**

Total market ₹12,269 Cr ($1.3B). Reachable ₹2,371 Cr ($250M). The year-5 scenario of about ₹23 crore is about 1% of the reachable market. AIFs, family offices and CA wealth practices are left out of these counts.

Search is the public's way in, and it is now being tested properly: 4,533 stock pages are in the sitemap. So far most search visitors look for Anvest by name, so stock-page search is unproven.

Why professionals come first

They buy tools for their work, they can be listed by name, and they will spot a wrong number faster than anyone. A product that survives them is ready for a beginner.

243 seats by month 15 is what the plan needs: about 1% of the first-buyer list.

First 90 days after close: the targets

200 firms contacted, from the SEBI directory

40 live demos

10 paid Desk pilots

Also: checkout live, and a first broker pilot scoped. Outreach starts at close.

NSE Market Pulse, Aug 2026. SEBI FY25 study of individual traders. SEBI directory, 19 Oct 2026. Cafemutual: ARN and EUIN holders, Jun 2026; top distributors, FY26. List prices: Plus ₹199 a month, Desk ₹2,999 a seat a month. Sitemap counted 1 Nov 2026.

Professionals pay first, which keeps the public tools open. On plan, $500K reaches break-even in month 42.

Who pays, and when (launch pricing; checkout goes live after close)

Plan	For whom, and what	Price	Month-15 revenue
Free	Everyone: public pages, screener, simulator, and a small allowance of AI questions with an account	₹0	Reach
Plus, Pro	Individuals: 150 to 600 AI questions a month, backtests, alerts, planning	₹199–₹599 a month	5%
Desk	Advisory, research and PMS teams, 1 to 5+ seats. Team workspace and coverage digests are built with this round	₹2,999 a seat a month	75%
Partner API	Brokers and wealth apps, once a partner signs. Nothing signed; first paid pilot planned for month 10	₹15, ₹10, ₹6 a user a month by volume	20%
Baskets	Rule-based baskets through brokers, after RA registration and empanelment	₹250 a month net, plus share	After Series A

Per team: 3 seats on average at ₹2,245 net a seat. CAC is ₹0.73 lakh a team, repaid by about 11 months of team revenue. Gross margin is 46% at month 15 and about 83% at year-5 scale. All are model inputs until pilots replace them.

If one assumption misses ($500K plan, costs unchanged)

Case	Month-15 ARR	Outcome
Plan as modelled	**₹87 L**	**Break-even month 42**
No paying partner	₹70 L	Cash to month 37
Sellers close 3 teams, not 4	₹73 L	Cash to month 39
Sellers close 2 teams, not 4	₹59 L	Cash to month 33
Teams average 2 seats, not 3	₹65 L	Cash to month 35
First sales slip 3 months	₹67 L	Break-even month 43
All of: no partner, 3 teams, 2 seats	₹39 L	Cash to month 29

Any single miss still leaves at least 33 months of cash. The combined case leaves 29.

Anvest operating model, a monthly build of users, conversion, churn, seller capacity, partner usage, salaries, serving, data and compliance. ARR is net of 18% GST. ₹95 = $1. Plan: ₹87 L at month 15, ₹1.12 Cr at month 18, cash low ₹51 lakh in month 41.

Good tools exist for each step. We found none that runs from filing to tested idea to plan in one account.

Product	What it does well	Where the user still has to leave
Screener.in	Fast ratio data and custom screens; AI over company documents, sold as credits	Backtesting and planning are not on its Premium page
Tijori	Natural-language screener, filing timeline, stock and fund tracking. Powers Kite's fundamentals; Zerodha invested about $5M (Nov 2025)	No backtests or planning shown on its site
Trendlyne	The closest broad alternative: AI screener creation, concall summaries, screener backtests, baskets	Paper trading and planning are not listed
Multibagg (Iris)	Plain-English answers from filings, broker-connected portfolio, WhatsApp alerts, free calculators	Backtesting and paper trading are not mentioned
Streak	Technical-rule strategies, backtests, paper and live trading through Zerodha	Built around price rules, with no filing research
Perplexity Finance, ChatGPT or Claude with Kite MCP	Free or cheap, broad, and improving fast. Perplexity carries live Indian earnings-call transcripts	No costed Indian backtest, and no repaired filings warehouse behind the answer
Anvest	**Filing answer to editable screen to costed backtest to paper trade, plus plain-language simulators and planners**	**Behind on: broker links and execution (none), page-level citations (filing level today), concall answers (thin), paying customers (none)**

Vendors' public product pages, read 19 Oct and 1 Nov 2026; Zerodha and press reports on Tijori and Perplexity. A feature not shown publicly may still exist, and we have not run paid hands-on trials yet.

One engineer built this in twelve months. The round turns that into a team.

Harsh Bhardwaj

Founder. Full-time at first close.

- B.Tech, Electronics and Communication, IIT Guwahati, 2015–19
- Seven years on high-throughput backends and distributed systems at New Relic, Shiprocket, Weave and Jaguar Land Rover
- Senior engineering lead on production multi-agent AI systems
- Wrote the XBRL repair, the OCR trust rules and the verification code behind the cases on page 3, with no outside capital

Why me: the failures on page 3 are data engineering at scale, which is what I have done for seven years. What I have not done is sell to advisers, so that is the first hire.

Hires funded by this round

Month	Role	Job
2	Growth and partnerships lead	Sells Desk pilots, runs broker conversations
3	Data engineer	Owns ingestion, OCR quality and freshness
6	Full-stack and quant engineer	Team workspace, alerts, strategy tools
9	Second seller (from $500K)	Scales Desk sales to 8 new teams a month

Compliance and capital-markets advisers are being appointed this round. None is named yet.

Hiring months and team counts come from the operating model.

Six reasons to pass, and what we are doing about each

Risk	Where it stands	What we do about it
Nobody has paid yet	Pre-revenue. 13 outside accounts were asking questions by 20 Oct.	10 paid pilots is the first test. If 200 firms produce fewer than 3, we change the buyer or the price before hiring the second seller.
A wrong number reaches a beginner	Numeric checks run before display. Revenue and profit matched on 50 of 50 audited filings; end-to-end answers have no published benchmark yet.	New AI builds stay held until they pass an evaluation they have not seen. A public benchmark is due by month 6.
The line between information and advice	No buy, sell or hold calls, no target prices. Planning is arithmetic on the user's own inputs.	RA registration is funded, and counsel reviews planning features before release. Personal portfolio advice would need separate adviser registration.
Data rights and source access	Filings are public, but redistribution terms need confirming. BSE's API and MCX's feed block us today.	$65K covers counsel, licence and serving. Stale data is hidden rather than shown.
Bigger players move in	Zerodha backs Tijori and Streak. Perplexity gives Indian transcripts away. Screener sells AI credits.	Sell directly to advisers, depend on no single broker, and compete on checked data and the connected flow.
One founder, not yet full-time	Everything so far is one person's work.	Full-time at first close. Three hires by month 6. Runbooks and scheduled jobs are documented.

Raising $500K to prove that advisers will pay and that beginners will stay

$3.5M post-money cap. CCD or CCPS, to be settled with counsel. Same terms for every investor. First close $400K, room to $700K.

Where the $500K goes

Amount	Use	What it pays for
$185K (37%)	Team	Growth lead, data engineer, full-stack and quant engineer, second seller from month 9
$65K (13%)	Compliance, data, serving	RA registration, counsel, exchange data licence, hosting and inference
$100K (20%)	Growth and founder	Pilots, launch, acquisition tests, founder salary
$150K (30%)	Runway after month 18	Pays the burn from month 19 to break-even in month 42 if no new round comes

What it should prove (targets from the model)

By	Target	Why it matters
Month 3	10 paid Desk pilots, checkout live	Someone pays
Month 6	~16 teams, public benchmark, RA application filed	Accuracy is checkable from outside
Month 12	~54 teams, ₹56 L ARR, first paid partner	Selling is repeatable
Month 15	77 teams, 243 seats, ₹87 L ARR	Unit economics replace assumptions
Month 18	~99 teams, ₹1.12 Cr ARR, retention measured	The evidence a Series A asks for

Other amounts: $400K gives ₹68 L ARR at month 15 and cash to month 31. $700K gives ₹1.06 Cr, with the second seller from month 6.

If it works, the public gets the tools and the company gets reach. The long-term scenario is about ₹23 crore ARR and about 7 lakh monthly users across anvest.in and broker partners by year 5. It depends on a Series A and on approvals.

harsh@anvest.in
anvest.in

Anvest operating model; ₹95 = $1. Long-term scenario built on the $500K plan: 3,40,177 site users and 3,83,373 partner users a month. Targets, not forecasts.

Appendix. How the plan reaches month-15 revenue

Line	Drivers	$400K	$500K	$700K
Desk	Founder 1 team a month from month 3. Each seller 4 teams a month once ramped, half rate for two months. 3 seats a team. 2% monthly churn, 1% seat growth. ₹2,245 net a seat.	₹3.9 L	₹5.5 L	₹6.2 L
Partners	Paid from months 10 and 14 ($700K: 9, 12, 15). 4,000 active users each, growing 6% a month. ₹15, then ₹10, then ₹6 a user by volume band.	₹1.4 L	₹1.4 L	₹2.2 L
Individuals	10,192 monthly users at month 15. 0.3% convert each month, 5% monthly churn, ₹200 net a subscriber.	₹0.4 L	₹0.4 L	₹0.5 L
Net MRR, month 15	After 18% GST and launch discounts	₹5.7 L	₹7.3 L	₹8.8 L
ARR run-rate	**Net MRR × 12**	**₹68 L**	**₹87 L**	**₹1.06 Cr**
Desk teams (seats)		55 (173)	77 (243)	88 (276)
Net burn a month	Month 15	₹13.9 L	₹15.4 L	₹15.6 L
Spend, months 1–18		₹3.02 Cr	₹3.32 Cr	₹3.66 Cr
With no new funding	Same team and spend continue	Cash to month 31	Break-even month 42	Break-even month 40

Anvest operating model. Every driver is a planning assumption until pilot data replaces it. The workbook is available in the data room. ₹95 = $1.

Appendix. What happens to the $500K plan when an assumption misses

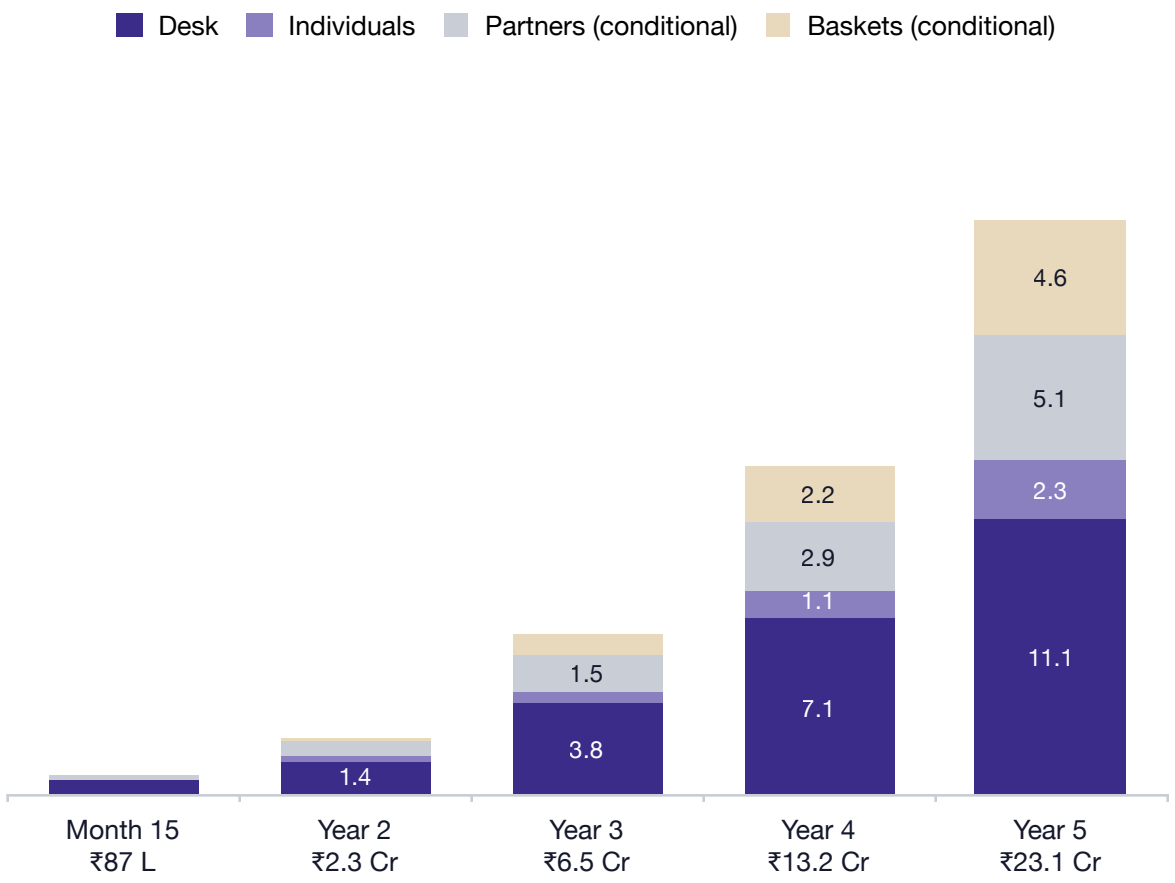

Case (costs stay as planned)	ARR, month 15	ARR, month 18	Teams, month 15	Cash low	Outcome with no new funding
Plan as modelled	**₹87 L**	**₹1.12 Cr**	**77**	**₹51 L**	**Break-even in month 42**
No paying partner	₹70 L	₹91 L	77	Below zero	Cash runs out in month 37; revenue covers costs by month 52
Sellers close 3 teams a month, not 4	₹73 L	₹94 L	61	Below zero	Cash runs out in month 39; revenue covers costs by month 47
Sellers close 2 teams a month, not 4	₹59 L	₹75 L	44	Below zero	Cash runs out in month 33; revenue covers costs by month 52
Teams average 2 seats, not 3	₹65 L	₹84 L	77	Below zero	Cash runs out in month 35; revenue covers costs by month 50
Monthly team churn 4%, not 2%	₹81 L	₹1.02 Cr	71	Below zero	Cash runs out in month 40; revenue covers costs by month 49
First Desk sales slip three months	₹67 L	₹92 L	54	₹6 L	Break-even in month 43
No partner, 3 teams a month, 2 seats	₹39 L	₹51 L	61	Below zero	Cash runs out in month 29; revenue covers costs by month 66

We would not run these cases to zero. Hiring the second seller depends on pilot evidence, so spending falls if Desk selling is slow. Holding costs fixed makes this table harsher than the real decision.

Anvest operating model, function sensitivities(). ₹95 = $1.

Appendix. Long-term scenario: about ₹23 crore ARR in year 5, if a Series A and approvals come through

Exit ARR by revenue line, ₹ crore

	Sellers*	Site users	Paying users	Desk seats	Partners (users)	ARR
Month 15	3	10,192	186	243	2 (9,593)	₹87 L
Year 2	6	24,015	496	532	4 (37,466)	₹2.32 Cr
Year 3	10	84,016	1,746	1,395	6 (94,213)	₹6.51 Cr
Year 4	13	1,69,058	4,519	2,634	8 (1,97,638)	₹13.22 Cr
Year 5	15	3,40,177	9,635	4,132	10 (3,83,373)	₹23.11 Cr

What has to be true

- A Series A near month 18 funds sellers and marketing; monthly users grow 11% a month to month 36, then 6%.
- Eight more partners sign from month 20, at 10,000 users each and tiered prices.
- Baskets start in month 22 only after RA registration, exchange empanelment and a partner broker.
- Desk and individuals alone reach ₹13.4 crore; partners and baskets add ₹9.7 crore.

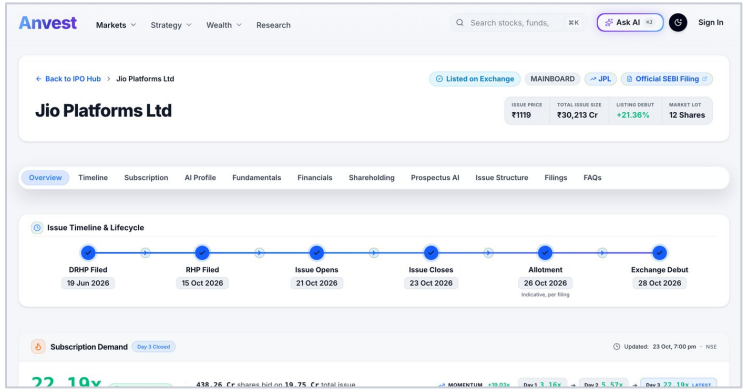

Anvest operating model, built on the $500K plan. *Including the founder. A scenario, not a forecast. ₹95 = $1.

Appendix. What a visitor can open today without signing in

Anvest Intelligence

Ask in plain English (questions need a free account)

Appendix. How an answer is produced, and what is not done yet

Step	What happens	Evidence or limit
Interpret	The model classifies the question and resolves the company and period.	Bad resolution fails closed: the answer asks or declines.
Retrieve	Evidence comes from the warehouse and the filing index, through the same services the pages use.	61,55,194 passages across 6,33,688 document IDs, 20 Oct 2026.
Compute	Code does the arithmetic. The model does not calculate.	Costs in backtests: brokerage, STT, stamp duty, slippage.
Validate	Numeric checks compare each figure with the retrieved values before display.	Reduces risk; it does not prove an answer correct.
Cite	Answers link to the filing behind the figure.	Filing-level today. Page-level citation is not live. Screening answers show the rule, not a citation.

Source audit, 20 Oct 2026: revenue and profit extraction matched 50 of 50 recent consolidated Q2 FY27 NSE XBRL filings, chosen by a fixed rule and rechecked from the source files. This tests extraction. It is not a score for AI answers.

Live spot-check, 19 Oct 2026: September-quarter answers for TCS, HCL Technologies and Wipro matched their NSE filings on revenue and profit; Infosys was correctly declined because it had not reported. Four questions are not a benchmark.

Release gate: new AI builds must pass a sealed evaluation before release. The current production build is from 21 October, and later builds are held until they pass. A public 50-question benchmark is a month-6 target.

Anvest source audit and product tests. The full method is in the data provenance memo.

Appendix. Regulatory position

Area	Position today	Next step
Advice boundary	Product rules, not only disclaimers: no buy, sell or hold calls, no target prices, no personalised investment advice.	Counsel reviews planning and portfolio features before each release.
Research analyst	Not registered.	RA application is funded and targeted by month 6. Approval is SEBI's decision.
Investment adviser	Not registered. Planning tools do arithmetic on the user's inputs and do not name securities.	Personal portfolio recommendations would need adviser registration and a separate decision.
AI in research	SEBI requires registered RAs and IAs to disclose AI use and holds them solely responsible for its output.	Sources and assumptions shown so a registered customer can do that review.
Retail algos	Backtests and paper trading are simulations. No live algo is offered.	Live strategies need legal review, partner-broker controls, empanelment and, for black-box logic, RA registration.
Exchange data	Filings are public disclosures. Public access does not settle redistribution rights.	Confirm exchange terms and budget the licence before paid redistribution.

SEBI RA and IA amendments, Dec 2024; SEBI retail algo circulars, 4 Feb and 30 Sep 2025. Position to be confirmed by counsel.

Appendix. Where rule-based investing goes, and where Anvest fits

54%
of NSE cash-market turnover is algorithmic

67%
of equity-derivatives turnover (73% in stock futures)

1 Apr 2026
SEBI's retail algo framework applies to all brokers

Stage	What the user does	Status
Idea	Ask an investing question in plain English	Live
Rules	Readable rules on fundamentals and technicals (P/E, ROE, RSI, SMA)	Live
Evidence	Backtest with Indian costs and periodic rebalancing	Live
Practice	Forward-test with virtual cash and a decision journal	Live
Deploy	Rebalance baskets through partner brokers, after RA registration and empanelment	Later

Exchange algo volume is mostly intraday and high-frequency. That is context, not retail demand. Anvest's lane is slower: filing-aware rules, tested and rebalanced periodically, for people who are not day traders.

NSE Market Pulse, Dec 2025 (turnover share, FY26 to November). SEBI circulars of 4 Feb and 30 Sep 2025.

Appendix. How we read the traffic, and what we leave out

Segment, 2 Oct to 1 Nov	Visitors	Views	Pages each	How we read it
India, Android	329	2,065	6.3	Real people on phones
India, Windows	226	1,129	5.0	Real people on desktops
India, Mac	58	433	7.5	May include the founder's own use
India, iPhone	55	242	4.4	Real people on phones
Singapore, Windows	465	483	1.0	One page each: looks automated. Excluded
US, Windows	218	228	1.0	One page each: looks automated. Excluded
US, Linux	217	390	1.8	Linux desktop share this high is unusual. Excluded
China, Windows	90	93	1.0	One page each: looks automated. Excluded

What these numbers are not

- Not a sign-up funnel. Six signed-in paths redirect to /login, so /login views are not intent.
- Not stock-page SEO yet. 85% of search visitors landed on the home page.
- Not unique people. Vercel counts a visitor per day.
- The 24 to 26 Oct jump was 360 India visitors, mostly Android, mostly from Google to the home page. The level since is about five times the earlier one.

Vercel Web Analytics, project anvest.in, exported 1 Nov 2026. Account and workflow counts in the deck come from a separate read-only production snapshot, 20 Oct 2026.

Appendix. Eighteen months of milestones, and what comes after

When	Product and data	Commercial	Team and regulatory
Months 1–6	Team workspace and coverage digests. Conversational wealth planning released. Public benchmark.	Checkout. 10 paid pilots, then ~16 Desk teams. Self-serve Plus and Pro.	Growth lead, data engineer, full-stack and quant engineer. RA application filed.
Months 7–12	Filing alerts. Partner endpoint built to a signed scope.	~54 teams, ₹56 L ARR. First paid partner in month 10.	Second seller in month 9. RA approval targeted.
Months 13–18	Page-level citations. Concall coverage.	~99 teams, ₹1.12 Cr ARR at month 18. Second partner.	Series A conversations, on measured retention and CAC.
After	One conversation across research, testing and planning, for every holding.	More partners, and team plans for distributors.	Baskets through brokers after approvals.

Anvest operating model and founder plan. Targets, not forecasts. Regulatory timing is SEBI's decision.
