Anvest

A checked Indian filings layer for the questions your users ask about what they own

A proposal for a small, read-only pilot with an opted-in group of Kite users. Nothing here is live on Kite, and no agreement exists. This is an invitation to test one specific idea.

6,086
listed symbols in the warehouse

2.94 million
corporate announcements

50 of 50
recent filings matched on revenue and profit extraction, 20 Oct 2026

Harsh Bhardwaj, founder | harsh@anvest.in | anvest.in | Prepared for Zerodha | Version 1 Nov 2026

Kite already has fundamentals, strategies and an AI connection. This tests the piece between them.

Layer	What exists in your ecosystem	What Anvest would add	What we are not claiming
Fundamentals	Tijori powers the Kite fundamentals widget and the Console timeline. Zerodha invested about $5M in Tijori (Nov 2025).	Answers in words from the filing behind a number, for the holdings a user owns.	Tijori is your partner and is adding AI of its own. It may do this too. A pilot would show whether the gap is real.
Strategies	Streak: no-code rules on price and technical indicators, with live deployment.	Rules that combine fundamentals and technicals, backtested with STT, stamp duty, brokerage and slippage.	Anvest does not execute. Live strategies need separate approvals.
AI access	Kite MCP lets a user connect an AI assistant to their account.	Checked Indian research that assistant could call, with the filing it came from.	No Anvest connection to Kite or Kite MCP exists.

The question for the pilot: “What did the companies I hold disclose this week, and did anything change?” Today that means opening PDFs one at a time. In the July to September quarter, NSE and BSE carried an average of 48,810 announcements a month.

Zerodha Z-Connect on the Tijori fundamentals widget and Console timeline; press reports on the Tijori investment, Nov 2025; Zerodha on Streak and Rainmatter. Announcement counts: Anvest warehouse, snapshot 20 Oct 2026.

The hard part is the data underneath, which is what took a year

What the source does	A real case	How far it goes
XBRL dates every column with the quarter, even the full-year figures.	RELIANCE Q4 filing: quarter and full-year contexts both say January to March.	Q4 and annual filings from FY23 onward
Cash flow is filed half-yearly and year-to-date, often under a context a parser rejects.	Recovered only when the four lines close their own identity.	15,899 rows recovered, none failing reconciliation
A secondary source and the filing disagree for the same period.	ADANIPORTS FY25 profit: ₹1,09,197 Cr in a secondary source, ₹11,092 Cr as filed.	3,608 conflicts across 1,022 companies
Bank results arrive as scans, with a hidden text layer that can be wrong in place.	City Union Bank Q1 FY27: capital adequacy 21.73 on the page, 27.73 in the text layer.	10 of 10 tier-1 bank results in a 21-filing sample

Live on anvest.in today: a filings warehouse, answers linked to the filing, natural-language screens, backtests with Indian costs and paper trading. The model reads the question; code does the arithmetic. If the data is missing, the answer says so.

Not built yet, and needed for a pilot: partner keys and an endpoint, a digest of filings by holding, and page-level citations (citations are at filing level today). We would build these to a scope you agree.

Anvest data audits, Jul to Sep 2026, and source audit, 20 Oct 2026. The source audit covers revenue and profit extraction on 50 filings; it does not score AI answers. No end-to-end benchmark is published yet.

A small pilot, judged the way your engineers would judge it

8 to 12 weeks. A small group of opted-in users. Read-only access through a path you approve. Criteria agreed before it starts.

What we measure	How	Threshold
Accuracy and citations	A sample of answers on real holdings, each figure checked against the filing by your reviewers	Agreed up front. Unsupported figures count as failures
Latency	p95 end to end, and retrieval alone, logged per request	Agreed up front. We will measure before quoting a number
Cost	Rupees per answered question, at pilot volume and projected to your scale	Agreed up front
Data handling	Least-privilege, user-authorised access. Retention, identity and token handling set by your security review	Pass or fail, by your team
Repeat use	Weekly return of the opted-in group, compared with a control if you want one	Agreed up front

If the results justify it: a per-active-user licence, usage pricing or a white-label layer. If they do not, we stop, and you keep the findings.

Proposed terms. No pilot, permission or commercial agreement exists.

Suggested next step: thirty minutes with your engineers on the pipeline and the live product

What I would like to learn from you

- Whether answers from filings on a user's own holdings are a question your users actually ask
- What an approved, read-only access path would look like, and what your security review needs
- Whether Tijori's roadmap already covers this, in which case I would like to know

Separately, Anvest is raising a seed round. This pilot does not depend on it, and it is not part of this proposal. If Rainmatter would like to look at it, I am happy to share the investor material on its own track.
